

Brexit – what’s your strategy? Make Aqua your next move.

At a time when uncertainty and speculation around Brexit is rife, it’s hard to accurately predict how UK businesses will be affected when you consider exchange rates, import tariffs and logistics, speculation around commodity prices, shipment delays and product shortages abound.

As a company that works closely with a supplier network across the EU, we’re working on ways to ensure our customers and their business operations are unaffected, whatever the outcome of the current negotiations.

Below, we’ve outlined some of the ways in which the Aqua Group can help you with your Brexit planning and keep your business on track.

Critical cooling system spares

With the future trading landscape between the UK and EU unclear, many clients have already asked us how we think the various Brexit outcomes could affect lead-times on spare parts for their chillers and other cooling equipment. The honest answer is – we don’t know. But what we do know is that, for many of our customers, a critical and unexpected part failure can have a major business impact unless the issue is resolved very quickly. If Brexit affects spare part lead-times the consequences could be disastrous.

So, we’ve developed a package of critical spares and long lead-time items for our customers, all of which are available to purchase now in readiness for the Brexit outcome. With parts on site, should you have a critical failure at any point, it’ll just take a call to our Service team and we’ll despatch an engineer to your site to get you back up and running. We can supply parts for most major equipment brands.

For details and pricing on critical spares provision for your specific application call our Service team today on **0333 222 9040**.

Preventive maintenance plans

Why not also consider taking out one of our Preventive Maintenance Plans to give you complete peace of mind? There are two plans available – a Standard next working day response and Premium six-hour response. Under either plan, a dedicated engineer will visit your site twice or four times per year (depending on the plan chosen) at a time tailored to your needs. This will help identify potential future failure points through wear & tear, leading to increased energy efficiency, uptime and reliability.

Aqua Hire + contingency planning

In addition to critical spares and preventive maintenance, the Aqua Group have a dedicated hire division with a fleet of temperature control equipment available on short, medium or long-term hire. Our hire agreements are fully flexible, starting from just one week and we can arrange next day delivery across the UK. So, if for any reason our engineers can’t get you back up and running, we can deliver hire equipment to your site to keep your business operational until the issue is resolved.

Aqua Hire also offers a full contingency planning service – where an engineer will come to your site and evaluate your equipment and set up and detail everything you would need should your current system ever fail. That way, you have your “plan b” ready should the worse happen. You’ll find more information on our website - <https://aquahire.co.uk/temperature-control-contingency-planning/>

So, don’t leave things to chance when it comes to Brexit, call our Service Division today on 0333 222 9040 and we’ll help you ensure your critical business operations are protected.
